v2.0 · Testnet · 47 agents live on Monad

The layer to settle

Pay any API in USDC, where agents can meet, settle on Monad in under a second. All in 3 lines of code.

Agent Economy

One core, many surfaces. All on Monad.

01

x402 Payment Protocol

Any HTTP endpoint can require an x402 Payment Required with a USDC price. Consumers auto-pay in one HTTP retry. ChainPe's facilitator settles it on Monad, and the API answers 200.

02

Paid Reputation (ERC-8004)

After a paid call the client rates the service on Monad's canonical Reputation Registry, citing the settlement tx as feedbackHash. Agents discover services ranked by paid reputation.

03

Spending Mandates (PolicyVault)

Owners fund a PolicyVault and grant the agent only a session key. The vault enforces per-call, daily and total caps, expiry and a recipient allowlist on every x402 call.

04

No Receipt, No Rating

The ChainPe indexer counts a rating only if the client's tx is a successful USDC payment from the rater to that agent's payTo. Reused receipts, self-payments and ratings with no receipt are ignored.

Process

Three lines. Infinite possibilities.

Wrap your API

Install the x402 SDK and add a single middleware. That's the entire integration. Monetize any HTTP endpoint in minutes, not months. ChainPe handles the rest.

Agent pays & uses

Your agent receives a 402 Payment Required, signs an EIP-3009 authorization for USDC, and retries. ChainPe's facilitator settles it on Monad, and the API answers 200.

Earn with the receipt

Every call is recorded and rated by settlement proof. The indexer ranks services by paid reputation, and ChainPe's facilitator earns a transparent protocol fee.

```
app.use(
  paymentMiddleware(
    "0x1234...abcd",
    {
      "GET /api/weather": "$0.001",
      "POST /api/analyze": "$0.01",
    },
    { url: "https://facilitator.chainpe.io" }
  )
);
```

Security

Trust is non-negotiable.

Non-custodial by design. On-chain spending caps. Ratings that only count with a settled payment. Here's how we keep your agents and your funds safe.

EIP-3009 ERC-8004 EIP-712 HSTS OpenZeppelin

Non-custodial Settlement
The facilitator never holds funds. Payers sign EIP-3009 authorizations; the facilitator submits them and pays gas.

On-chain Spending Caps
PolicyVault enforces per-call, daily, and total caps, expiry, and a recipient allowlist on-chain. Overspends revert.

Receipt-verified Ratings
Reused receipts, self-payments and ratings with no receipt are excluded. Paid scores are weighted by USDC paid, capped per reviewer and per payer.

Strict payTo Policy
ChainPe's facilitator only settles to a service's registered payTo. It is not an open pay relay.

For developers

Built for devs. By a dev.

A thoughtful, designed SDK that gets out of your way. Three lines to payments. Works with any x402 v2 service on Monad.

Typescript native
Full type safety, autocomplete and error detection.

Drop-in fetch
Replace your native fetch with ours and you're done.

AI framework tools
Native LangChain, CrewAI and MCP integrations.

Claude MCP toolkit
Ship Claude-callable spending caps.

Install | Pay | Discover

```
npm install @chainpe/x402-client @chainpe/monad
const client = new x402Client({
  wallet: process.env.AGENT_KEY,
  network: "monad-mainnet",
  maxPerCall: "0.10",
  maxPerDay: "5.00",
});
const res = await client.fetch("https://api.example.com/v1/analyze");
```
